

Journal of Mechatronics, Electrical Power, and Vehicular Technology

Volume 08, Issue 1, July 2017

AIM AND SCOPE

Journal of Mechatronics, Electrical Power, and Vehicular Technology (MEV) is an internationally peer-reviewed journal aims to provide authoritative global source of scientific information for researchers and engineers in academia, research institutions, government agencies, and industries. The Journal publishes original research papers, review articles and case studies focused on:

Mechatronics: including control system, robotic, CNC Machine, sensor, signal processing, electronics, actuator, and mechanical dynamics.

Electrical Power: including power generation, transmission system, new and renewable energy, turbine and generator design and analysis, grid system, and source assessment.

Vehicular Technology: including electric/hybrid vehicle design and analysis, vehicle on grid, fuel efficiency, and safety analysis.

Selected Applications: including all implementations or implications related to mechatronics, electrical power, or vehicular technology.

MEV's vision is to become an international platform with high scientific contribution for the global community. MEV's mission is presenting important results of work, whether in the form of research, development, application, or design.

IMPRINT

MEV is published by Research Centre for Electrical Power and Mechatronics - Indonesian Institute of Sciences (RCEPM-LIPI).

ISSN print: 2087-3379

ISSN electronics: 2088-6985

Electronics edition is available at:
<http://www.mevjournal.com>

All published article are embedded with DOI number affiliated with Crossref DOI prefix 10.14203 Indonesian Institute of Sciences (LIPI)

PUBLICATION FREQUENCY

MEV is managed to be issued twice in every year. The first issue should be in the mid of the year (July) and the second issue is at the end of the year (December).

PEER REVIEW POLICY

MEV reviewing policies are:

Every submitted paper will be reviewed by at least two peer-reviewers.

Reviewers are unaware of the identity of the authors, and authors are also unaware of the identity of reviewers (double blind review method).

Reviewing process will consider novelty, objectivity, method, scientific impact, conclusion, and references.

ACCREDITATION

MEV has been certificated as an Indonesian Scientific Journal by Indonesian Institute of Sciences (LIPI). MEV has also been certificated by Ministry of Research, Technology and Higher Education (RTHE) as an online scientific journal.

LIPI Accreditation:

Acc Number:
633/AU/P2MI-LIPI/03/2015

Acc date: 15 April 2015
Valid thru: 15 April 2020.

RISTEKDIKTI Accreditation:

Acc Number:
1/E/KPT/2015

Acc date: 15 September 2015
Valid thru: 21 September 2020.

COPY EDITING AND PROOFREADING

Every article accepted by MEV Journal shall be an object to **Grammarly**® writing-enhancement program conducted by MEV Journal Editorial Board.

REFERENCE MANAGEMENT

Every article submitted to MEV Journal shall use reference management software e.g. **Endnote**® or **Mendeley**.

OPEN ACCESS POLICY

MEV Journal provides immediate open access to its content on the principle that making research freely available to the public to supports a greater global exchange of knowledge.

PROCESSING CHARGES

Every article submitted to MEV Journal **will not have** any Article Processing Charges. This includes submission, peer-reviewing, editing, publishing, maintaining and archiving, and allows immediate access to the full text versions of the articles.

PLAGIARISM CHECK

Plagiarism screening will be conducted by MEV Editorial Board using **Crossref Similarity Check**™ powered by **iThenticate**® and also using **Grammarly**® Plagiarism Checker.

CROSSMARK

Every article will be published along with **Crossmark** button in the PDF and in the online abstract page. Crossmark gives readers quick and easy access to the current status of a piece of content.

CITED-BY

Published article will be equipped with Crossref **Cited-by** service. Cited-by lets publishers show authors and readers what other Crossref content is citing their content.

INDEXING & ABSTRACTING

MEV has been covered by these following indexing services:

EBSCOhost, Google Scholar, Directory of Open Access Journal (DOAJ), Crossref, Indonesian Scientific Journal Database (ISJD), Indonesian Publication Index (IPI), CiteULike, Cite Factor, Academic Journal Database, ResearchBib, Bielefeld Academic Search Engine (BASE), WorldCat, Sherpa Romeo, Index Copernicus, Open Academic Journal Index (OAJI), Open Access Articles, ROAD: the Directory of Open Access Scholarly Resources, Toronto Public Library, Western Theological Seminary, Ghent University Library, and Electronic Journals Library.

CC LICENSE

MEV Journal by **RCEPM-LIPI** allows reuse and remixing of its content under a **CC BY-NC-SA Creative Commons Attribution-NonCommercial-ShareAlike 4.0 International License**. Permissions beyond the scope of this license may be available at <http://www.mevjournal.com>.

Journal of Mechatronics, Electrical Power, and Vehicular Technology

Volume 08, Issue 1, July 2017

FOREWORD FROM EDITOR-IN-CHIEF

Journal of Mechatronics, Electrical Power, and Vehicular Technology (MEV) is an international journal indexed by many internationally recognized indexes. MEV Digital Object Identifier (DOI) Prefix is 10.14203. In this issue, seven papers are published with the total number of 69 paper pages. The authors come from Indonesia, PR China, United Kingdom, Australia, and Malaysia.

Two papers are related to mechatronics. One paper describes performance comparison for formation control of multiple nonholonomic wheeled mobile robots, and the other presents design and implementation of hardware in the loop simulation for electronic ducted fan rocket control system.

Three papers address topics on electrical power. The first paper deals with a compact design of multi-feeder data logging system for power quality measurement. The second paper describes a method to increase efficiency of a 33 MW OTEC in Indonesia using flat-plate solar collector. The third paper presents optimization of SMES and TCSC using particle swarm optimization for oscillation mitigation in a multi machine power system.

In the scope of vehicular technology there are two papers presented. The first paper reports a simulation study to compare RLS-GA and RLS-PSO algorithms for Li-ion battery SOC and SOH estimation. The second paper describes AFR and fuel cut-off modeling of LPG fueled engine using fuzzy logic controller.

Since the first volume, our journal provides convenience for authors to submit the paper by waiving the article processing charge. In order to improve the quality of the journal, we are on process to register the journal to international academic citation index. We wish to offer our thanks to the Indonesian Institute of Sciences (LIPI) for their perpetual supports. Also, we would like to acknowledge our immense gratitude to our International Editorial Board members, reviewers and authors for their great contributions for the advancement of this journal.

We sincerely hope this publication would contribute to the enhancement of science and technology.

A compact design of multi-feeder data logging system for power
quality measurement with a multiplexer and a single PQ transducer

*Journal of Mechatronics, Electrical Power, and Vehicular
Technology*, July 2017, vol. 8, no. 1, p. 1-10, 13 ill, 7 tab, 15 ref.

This paper presents a simple and costs effective equipment design
multi-feeder data logger for recording and monitoring power
quality. The system design uses remote supervising and multi-
feeder data logging system (RESMOS). The data collected through
resmos portable unit (RMPU) will automatically be saved with the
format as binary and comma separated value (CSV). The time
setting on the RMPU can be configured with minimum one minute
per logging. This data logger uses a single transducer with a
multiplexer for recording and monitoring ten channels of power
quality at busbar. The system design has been validated with
national metrology laboratory scientific and industrial research
institute of Malaysia (SIRIM). This tool has the advantage that it
can be used to measure harmonic data more than 21st at the same
time for ten channels and equipped with software making it easier
for analysis data with low operational costs versus another power
quality equipment. The experimental results indicate that the
proposed technique can accelerate data reading with conversion rate
one sample per second for each channel. The device can be used to
measure harmonic level and power quality with a confidence level
above 95% and percentage error under 2.43% for total harmonics
distortion (THD) and 1.72% for voltage harmonics.

Optimization of SMES and TCSC using particle swarm
optimization for oscillation mitigation in a multi machines power
system

Journal of Mechatronics, Electrical Power, and Vehicular

Technology, July 2017, vol.8, no. 1, p. 11-21, 17 ill, 8 tab, 24 ref.

Due to the uncertainty of load demand, the stability of power system
becomes more insecure. Small signal stability or low-frequency
oscillation is one of stability issues which correspond to power
transmission between interconnected power systems. To enhance
the small signal stability, an additional controller such as energy
storage and flexible AC transmission system (FACTS) devices
become inevitable. This paper investigates the application of
superconducting magnetic energy storage (SMES) and thyristor
controlled series compensator (TCSC) to mitigate oscillation in a
power system. To get the best parameter values of SMES and
TCSC, particle swarm optimization (PSO) is used. The performance
of the power system equipped with SMES and TCSC was analyzed
through time domain simulations. Three machines (whose power
ratings are 71.641, 163, and 85 MW) nine buses power system was
used for simulation. From the simulation results, it is concluded that
SMES and TCSC can mitigate oscillatory condition on the power
system especially in lowering the maximum overshoot up to 0.005
pu in this case. It was also approved that PSO can be used to obtain
the optimal parameter of SMES and TCSC.

Performance comparison of consensus protocol and 1- ϕ approach
for formation control of multiple nonholonomic wheeled mobile
robots

*Journal of Mechatronics, Electrical Power, and Vehicular
Technology*, July 2017, vol. 8, no. 1, p. 22-32, 20 ill, 1 tab, 24 ref.

This paper investigates formation control of multiple nonholonomic
differential drive wheeled mobile robots (WMRs). Assume the
communication between the mobile robots is possible where the
leader mobile robot can share its state values to the follower mobile
robots using the leader-follower notion. Two approaches are
discussed for controlling a formation of nonholonomic WMRs. The
first approach is consensus tracking based on graph theory concept,
where the linear and angular velocity input of each follower are
formulated using first order consensus protocol, such that the
heading angle and velocity of the followers are synchronized to the
corresponding values of the leader mobile robot. The second is 1- \square
approach (distance angle) that is developed based on Lyapunov
analysis, where the linear and angular velocity inputs of each
follower mobile robot are adjusted such that the followers keep a
desired separation distance and deviation angle with respect to the
leader robot, and the overall system is asymptotically stable. The
aim of this paper is to compare the performances of the presented
methods for controlling a formation of wheeled mobile robots with

matlab simulations.

Increasing efficiency of a 33 MW OTEC in Indonesia using flat-plate solar collector for the seawater heater

Journal of Mechatronics, Electrical Power, and Vehicular Technology, July 2017, vol. 8, no. 1, p. 33-39, 10 ill, 1 tab, 17 ref.

This paper presents a design concept of Ocean Thermal Energy Conversion (OTEC) plant built in Mamuju, West Sulawesi, with 33 MWe and 7.1% of the power capacity and efficiency, respectively. The generated electrical power and the efficiency of OTEC plant are enhanced by a simulation of a number of derived formulas. Enhancement of efficiency is performed by increasing the temperature of the warm seawater toward the evaporator from 26°C up to 33.5°C using a flat-plate solar collector. The simulation results show that by increasing the seawater temperature up to 33.5°C, the generated power will increase up to 144.155 MWe with the OTEC efficiency up to 9.54%, respectively. The required area of flat-plate solar collector to achieve the results is around 6.023×10^6 m².

Comparison between RLS-GA and RLS-PSO for Li-ion battery SOC and SOH estimation: a simulation study

Journal of Mechatronics, Electrical Power, and Vehicular Technology, July 2017, vol. 8, no. 1, p. 40-49, 9 ill, 3 tab, 24 ref

This paper proposes a new method of concurrent SOC and SOH estimation using a combination of recursive least square (RLS) algorithm and particle swarm optimization (PSO). The RLS algorithm is equipped with multiple fixed forgetting factors (MFFF) which are optimized by PSO. The performance of the hybrid RLS-PSO is compared with the similar RLS which is optimized by single objective genetic algorithms (SOGA) as well as multi-objectives genetic algorithm (MOGA). Open circuit voltage (OCV) is treated as a parameter to be estimated at the same timewith internal resistance. Urban Dynamometer Driving Schedule (UDDS) is used as the input data. Simulation results show that the hybrid RLS-PSO algorithm provides little better performance than the hybrid RLS-SOGA algorithm in terms of mean square error (MSE) and a number of iteration. On the other hand, MOGA provides Pareto front containing optimum solutions where a specific solution can be selected to have OCV MSE performance as good as PSO.

(Author)

Keywords: Li-Ion; battery; state of charge (SOC); state of health (SOH); recursive least square (RLS); particle swarm optimization (PSO); genetic algorithm (GA).

Muji Setiyo^{*}, Suroto Munahar (Department of Automotive Engineering, Universitas Muhammadiyah Magelang, Magelang, Indonesia, Jl. Bambang Sugeng km.05 Mertoyudan Magelang 56172)

AFR and fuel cut-off modeling of LPG-fueled engine based on engine, transmission, and brake system using fuzzy logic controller

(FLC)

Journal of Mechatronics, Electrical Power, and Vehicular Technology, July 2017, vol. 8, no. 1, p. 50-59, 12 ill, 3 tab, 42 ref.

During deceleration, continuous fuel flows into the engine not only causing over fuel consumption but also increasing exhausts emissions. Therefore, this paper presents a simulation of AFR and fuel cut-off modeling in the LPG-fueled vehicle using Fuzzy Logic Controller (FLC). The third generation of LPG kits (Liquid Phase Injection, LPI) was chosen due to its technological equivalency to EFI gasoline engine and promising to be developed. Given that the fuel system control is complex and non-linear, FLC has been selected because of simple, easy to understand, and tolerant to improper data. Simulation results show that the AFR and fuel cut-off controller able to maintenance AFR at the stoichiometric range during normal operation and able to cut the fuel flow at deceleration time for saving fuel and reducing emissions.

(Author)

Keywords: LPG-fueled engine; deceleration; FLC; AFR; fuel cut-off.

Reza Aulia Yulnandi^{*}, Carmadi Machbub, Ary Setijadi Prihatmanto, Egi Muhammad Idris Hidayat (School of Electrical Engineering and Informatics, Institut Teknologi Bandung, Jl. Ganesha 10, Bandung 40132, Indonesia)

Design and implementation of hardware in the loop simulation for electric ducted fan rocket control system using 8-bit microcontroller and real-time open source middleware

Journal of Mechatronics, Electrical Power, and Vehicular Technology, July 2017, vol. 8, no. 1, p. 60-69, 20 ill, 2 tab, 12 ref.

Hardware in the Loop Simulation (HILS) is intended to reduce time and development cost of control system design. HILS systems are mostly built by integrating both controller hardware and simulator software where the software is not an open source. Moreover, implementing HILS by using manufactured system is costly. This paper describes the design and implementation of HILS for Electric Ducted Fan (EDF) rocket by using open-source platform for development with middleware. This middleware system is used to bridge the data flow between controller hardware and simulator software. A low-cost ATMEGA 2560 8-bit microcontroller is used to calculate rocket's attitude with Direction Cosine Matrix (DCM) algorithm and PID controller is employed to regulate rocket's dynamics based on desired specifications. X-Plane 10 simulator software is used for generating simulated sensory data. The test results validate that HILS design meets the defined specifications, i.e. angle difference of 0.3 degrees and rise time of 0.149 seconds on pitch angle.

(Author)

Keywords: HILS; DCM; open-source platform; X-Plane; middleware; EDF rocket.
